1、封装promise

```
import ojsonp from 'jsonp'

export default function jsonp(url,data,option){
    url += (url.indexOf('?')<0?'?':'&')+param(data)

    return new Promise((resolve,reject)=>{
        ojsonp(url,option,(err,data)=>{
            if(!err){
                resolve(data)
            }else{
                reject(err)
            }
        })
    })
}
function param(data){ // 把data对象转化为字符转拼接
    let url = ''
    for(let [k,v] of Object.entries(data)){
        url += `&${k}=${v}`
    }
    return url?url.substring(1):''
}
```
